**Assignment 9**

- The equation  $y'' + y' - xy = 0$  has a power series solution of the form  $\sum a_n x^n$ .
  - Find the power series solutions  $y_1(x)$  and  $y_2(x)$  such that  $y_1(0) = 1, y_1'(0) = 0$  and  $y_2(0) = 0, y_2'(0) = 1$ .
  - Find the radius of convergence for  $y_1(x)$  and  $y_2(x)$ .
- Consider the differential equation  $(1 + x^2)y'' - 4xy' + 6y = 0$ .
  - Find its general solution in the form  $y = a_0 y_1(x) + a_1 y_2(x)$ , where  $y_1$  and  $y_2$  are power series.
  - Find the radius of convergence for  $y_1(x)$  and  $y_2(x)$ .
- (a) Show that the fundamental system of solutions of Legendre equation

$$(1 - x^2)y'' - 2xy' + p(p+1)y = 0$$

consists of  $y_1(x) = \sum_{n=0}^{\infty} a_{2n} x^{2n}$  and  $y_2(x) = \sum_{n=0}^{\infty} a_{2n+1} x^{2n+1}$ , where  $a_0 = a_1 = 1$  and

$$a_{2n+2} = -\frac{(p-2n)(p+2n+1)}{(2n+1)(2n+2)} a_{2n} \quad n = 0, 1, 2, \dots$$

$$a_{2n+1} = -\frac{(p-2n+1)(p+2n)}{2n(2n+1)} a_{2n-1} \quad n = 1, 2, 3, \dots$$

(b) Verify that

$$y_1(x) = P_0(x) = 1, \quad y_2(x) = \frac{1}{2} \log \left\{ \frac{1+x}{1-x} \right\} \quad \text{for } p = 0$$

$$y_2(x) = P_1(x) = x, \quad y_1(x) = 1 - \frac{x}{2} \log \left\{ \frac{1+x}{1-x} \right\} \quad \text{for } p = 1.$$

(c) The expression,  $P_n(x) = \frac{1}{2^n n!} \frac{d^n}{dx^n} [(x^2 - 1)^n]$ , is called the Rodrigues' formula for Legendre polynomial  $P_n$  of degree  $n$ . Assuming this, find  $P_1, P_2, P_3, P_4$ .

4. Using Rodrigues' formula for  $P_n(x)$ , show that

$$\begin{aligned} (i) P_n(-x) &= (-1)^n P_n(x) & (ii) P_n'(-x) &= (-1)^{n+1} P_n'(x) \\ (iii) \int_{-1}^1 P_n(x) P_m(x) dx &= \frac{2}{2n+1} \delta_{mn} & (iv) \int_{-1}^1 x^m P_n(x) dx &= 0 \text{ if } m < n. \end{aligned}$$

5. Suppose  $m > n$ . Show that  $\int_{-1}^1 x^m P_n(x) dx = 0$  if  $m - n$  is odd. What happens if  $m - n$  is even?

6. The function on the left side of  $\frac{1}{\sqrt{1-2xt+t^2}} = \sum_{n=0}^{\infty} P_n(x) t^n$  is called the generating function of the Legendre polynomial  $P_n$ . Using this relation, show that

$$\begin{aligned} (i) (n+1)P_{n+1}(x) - (2n+1)xP_n(x) + nP_{n-1}(x) &= 0 & (ii) nP_n(x) &= xP_n'(x) - P_{n-1}'(x) \\ (iii) P_{n+1}'(x) - xP_n'(x) &= (n+1)P_n(x) & (iv) P_n(1) &= 1, P_n(-1) = (-1)^n \\ (v) P_{2n+1}(0) &= 0, P_{2n}(0) &= (-1)^n \frac{1 \cdot 3 \cdot 5 \cdots (2n-1)}{2^n n!} \end{aligned}$$
